You will find the files to solve this evaluation test in the following folder:

`https://github.com/nicolasserrano/CS/tree/master/webapps/SE2025_02_18`

Delivery instructions are in the ADI content area.

Images

The images of the robots are at the following url:

https://nicolasserrano.github.io/CS/webapps/auxiliary/robots/imageN.jpg

The name of the files is imageN.jpg, where N is the order of the robot: image1.jpg to cover6.jpg

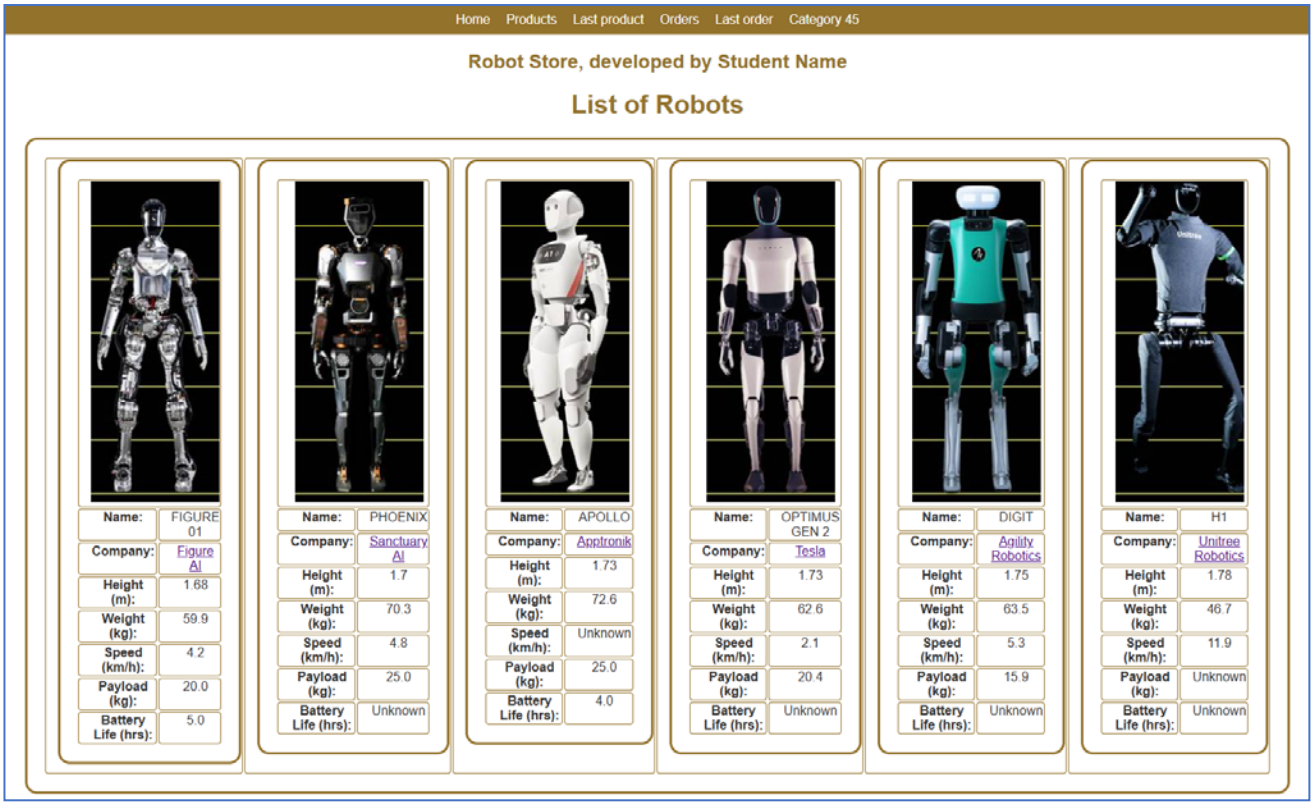
For example:

https://nicolasserrano.github.io/CS/webapps/auxiliary/robots/image3.jpg

They appear on the web page using the <*img*> tag, for example:

<img src="https://nicolasserrano.github.io/CS/webapps/auxiliary/robots/image3.jpg">

Exercise 1 (5 points)



Develop a servlet called **RobotListMockup** that lists all the robot models returned by the `getRobotList()` function in the `RobotDataMockup` class.

The title below the menu should be: "**Robot Store, developed by Student Name**". Replace Student Name by your Name and Surname.

Each robot must be in a table. All the tables of the robots must be in a horizontal table (a table with one row).

For each robot, the table shows: - Image, Name, Company, Weight (kg), Speed (km/h), Payload (kg), Battery Life (hrs)

The images have the property: `width="160px"`.

The format should be similar to the one shown in the image. Note that the labels are bold (<b>).

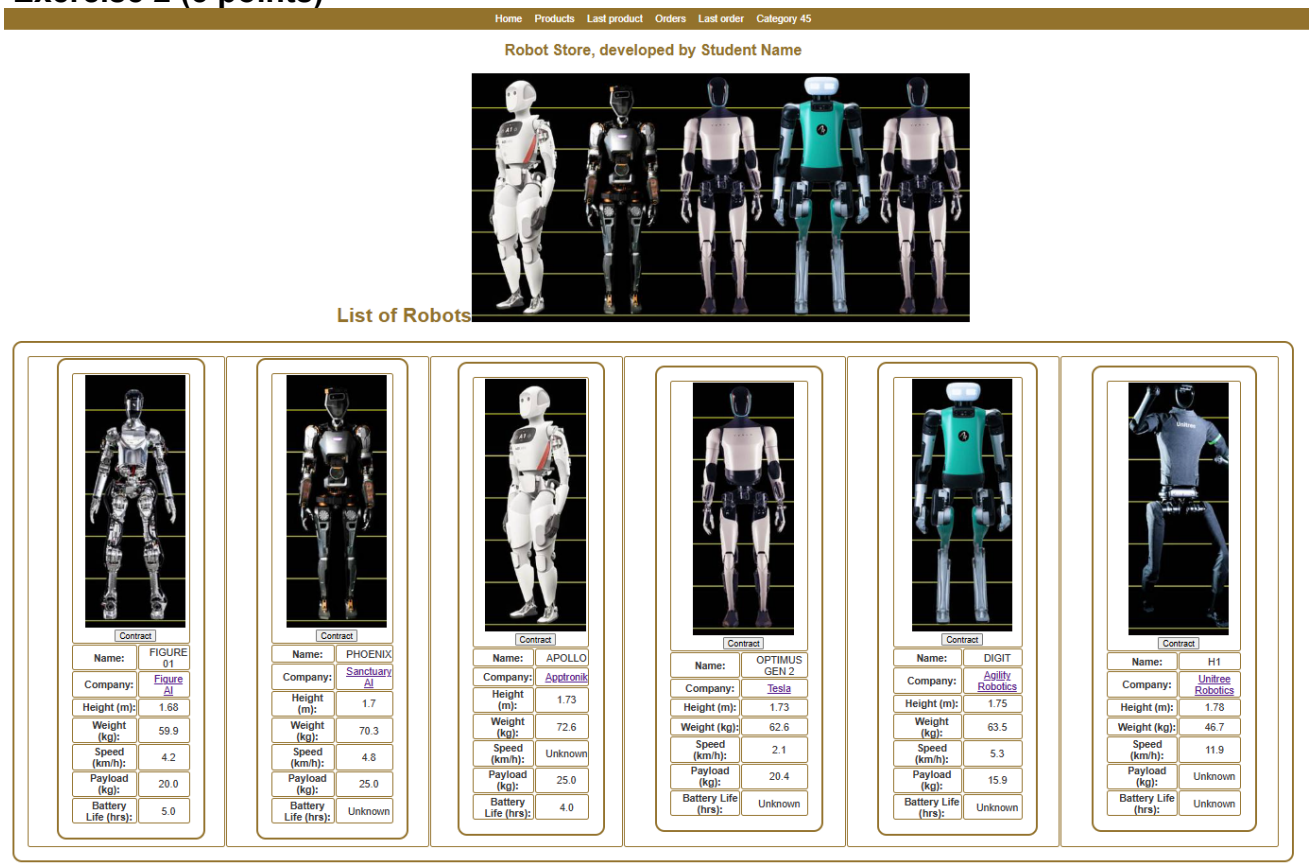
The company link opens the url of the company, which is on the data, in a new tab (attribute target='_blank').

The process for obtaining the images is explained on the previous page.

Mark the sections you have done:

- ☐ *The solution works and is in the folder SE2025_02_18 and compressed in the SE2025_02_18.zip file (0.5 point)*
- ☐ *The solution shows your name and surname before the table (0.5 point)*
- ☐ *The solution shows a table for each robot (1.0 point)*
- ☐ *The solution shows the data of each model with the specified fields (1.0 points)*
- ☐ *The solution shows the robots in a row with the format of the image (0.5 points)*
- ☐ *The solution shows the images of the robots (1.0 point)*
- ☐ *The solution has the correct url for the links (0.5 points)*

Exercise 2 (5 points)

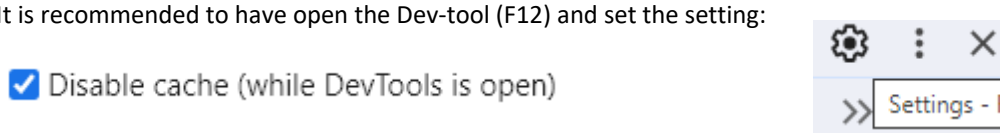


In the evaluation test folder, you will find the **RobotList_JS.html** file. This file includes the file *robots.js*. Currently this file only shows an alert. You should modify the *robots.js* file to add a button after each robot image with the value "Contract".

When the user clicks the button, a new image with the src of the corresponding robot is created in the header "List of Robots", so they appear before the table.

When the user clicks the image of one of the contracted robots, an alert with the name of the robot appears. You can store the name of the robot in the id or class of other elements; to set or get the class you can use the className property. Or you can get the name from the hierarchy of the DOM.

It is recommended to have open the Dev-tool (F12) and set the setting:



Mark the sections you have done:

- ☐ *The solution shows the button "Contract" in one of the robots with JavaScript (1.0 point)*
- ☐ *The solution shows the button "Contract" in all the robots with JavaScript (1.0 point)*
- ☐ *The button creates the copy of the image in the header (1.5 point)*
- ☐ *The click on the image of the contracted robots shows its name (1.5 point)*

Exercise 3, JSON (0.5 extra points)

Create a button at the end of the table, that when pressed, shows the JSON representation of the contracted robots showing the Name, Company and Height. The JSON must be created using the information of the DOM and presented using the method `stringify()`.

- [ ] *Done (1.0 point)*
